French EO Data & Services hubs

Missions of the Data & Services Hubs

- Federate works of several laboratories
 - Groups of scientists targeted to develop innovating algorithms for value-added products
- Facilitate access to data
- Contribute to the creation of new products and services by adding value to the available spatial, in-situ and campaigns data
 - Develop added value products and services for the science communities and national public actors
- Ensure long term preservation and facilitate the collection of heritage data
- Develop networks of competences /expertise
- Provide support and expertise to users:
 - Participate in the scientific, methodological and technical training of communities
 - Provide facilitation at regional level involving scientists, public and private users
- Support French achievements at European and international level

Data & Services Hubs

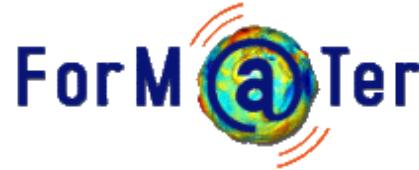

Data from space missions funded by CNES and scientifically exploited by (CNES, CNRS, IFREMER, Météo-France, IRD, IGN, ...) are made available to the scientific community through Data & services hubs specialized in one or more themes :

Earth Observation

- **AERIS** gathers 4 atmospheric data centers (ESPRI, ICARE, SEDOO, SATMOS).
- **FORM@TER** created in 2012 is dedicated to Solid Earth domain.
- **ODATIS** is a portal devoted to oceanography from satellite data via AVISO + for altimetry but also from coastal or offshore data collected in-situ.
- **THEIA** created in 2012 is specialized in land surfaces.
- **CDPP** specialized in the natural plasmas of the solar system was created in 1998.
- **CDS** is the oldest data center and has been collecting astronomical data since 1972.
- **MEDOC** created in 1995 is specialized in solar physics.

„Earth System“ Research Infrastructure

The Earth : a fascinating but complex system...

- numerous geophysical & geodynamic processes,
- with variable spatial and temporal scales,
- with many interactions, within and between its various compartments: solid Earth, land surfaces, ocean, atmosphere, (not forgetting interactions with anthroposphere and also Universe...)

Understanding these geophysical, geodynamic and geo-environment processes

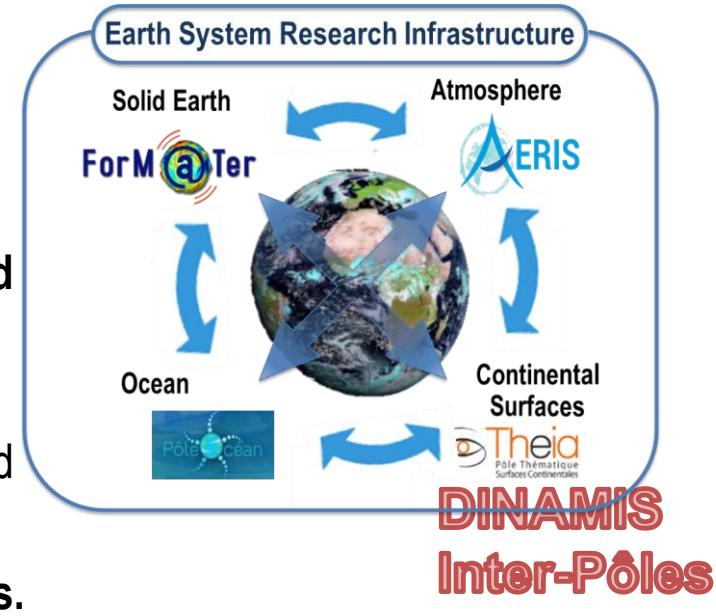

=> need to analyze numerous and very large datasets (satellite, *in situ*, campaigns, long term observations, but also experimentation results, model outputs, AI, ...).

Scientists and decision makers need to have an easy access to all these data and associated products!

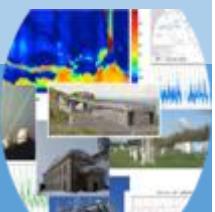

Missions of the “Earth System” RI

- **Federate** the Data & Services Hubs
- **FAIRisation** of datasets
- Develop **tools to access & analyze satellite and in-situ (ground, sea, airborne...) data**
- Ease and foster integrated & interdisciplinary **research** to understand the processes associated with the **Earth System and Global Changes**,
- develop european & international partnerships.
- Serve the scientific communities, the actors of public action and **downstream sector**

“Earth System” RI is positioned on the **whole data cycle** (in-situ and satellites), from their **production** (in synergy with other RIs and observatories) up to their **delivery** to **users** and to national, European and national **databases** and to national, European and international organizations (Copernicus, GEOSS, EOSC ...).

Structure & Organization of the Earth System RI

- ✓ a RI on the national research infrastructure road map
- ✓ 4 Data & Service Hubs

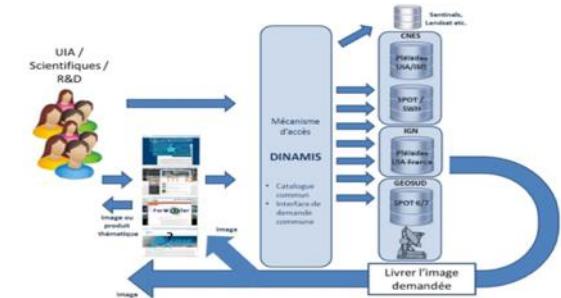

- ✓ THEIA : land surfaces
- ✓ AERIS : atmosphere
- ✓ Form@Ter : Solid Earth
- ✓ ODATIS : ocean

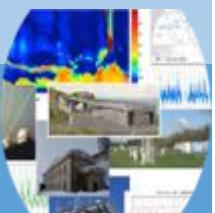

✓ Transverse initiatives

- ✓ DINAMIS : Mutualised satellite imagery distribution
- ✓ INTER-POLES committee : technical coordination
- ✓ Working group Europe

✓ Governance

- ✓ Steering board : 34 partners
- ✓ Executive board : CNRS, CNES, IFREMER, IGN, IRD, IRSTEA, Météo France, MESRI
- ✓ Directing Board: 4 Hubs Directors & Transverse Actions managers
- ✓ A Director & a team
- ✓ Operational structure : UMS CPST "Coordination Pôles de données et de services pour le Système Terre"

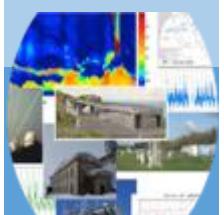

Priorities

- Reinforce Transverse initiatives
(DINAMIS, Inter-pôles WG, Europe/Int. WG, ...)
- Active participation in European initiatives
(H2020-EOSC and FP9, ESFRI, ENVRIfair, Copernicus,...)
- Active participation in international initiatives :
GEO/GEOSS, ONU-Env, GO FAIR,...
- develop an efficient integrated information system
(storage, archiving, processing, AI, cloud services, portals)
- Synergies and joint activities with Space Climate Observatory
- Development services based on **artificial intelligence**

AERIS

Form@ter

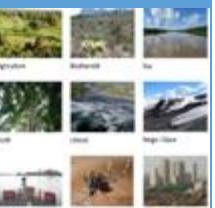

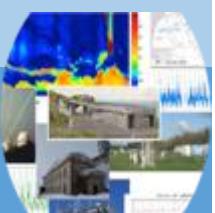

ODATIS

Status of the Data and Service Hubs

- 4/5 Data and Services Hubs (AERIS, FORM@TER ODATIS, THEIA & PNDB)
 - **Very different**
 - Not the same level of FAIRisation
 - Data from French / European satellites, but also from other countries (NASA, JAXA, USGS, NOAA, ...)
 - **In-situ data, models, ...**
 - Each Hub is distributed among several data & services centers
 - The current state of the Data & Services Hubs is to be taken into account
 - The volume of data is increasing
 - A mandate to open up to the **downstream sector**
- A few figures
 - ~20 Data & services infrastructures
 - 30 CES : scientific expertise consortium
 - 10 000 TB (2018) - 50 0000 TB (2022)
 - 350 scientists, data scientists, engineers, technicians - 170 FTE full time equivalent
- In progress & in discussion:
 - 5th data & Services hub on biodiversity : **PNDB**

Contexte des infrastructures

EOSC

Incontournable

- Fortes sources de financement
- Implication des ESFRI dans EOSC

INFRANUM

Incontournable

- Directive des Ministères

DIAS ESA & WeKEO

A considerer

- Certains AO pourraient imposer l'utilisation des DIAS
- Intégrer WeKEO nous permettrait de nous 'rapprocher' des données météo et climat' et de disposer éventuellement de moyens cloud commerciaux à proximité pour les usages aval

Les infrastructures en place dans les pôles

A considérer

- Sur la durée et selon ce qui sera faisable avec INFRANUM (contraintes du monde HPC)

PEPS

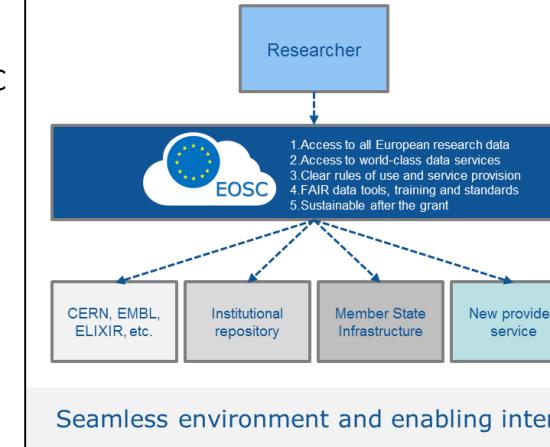

Utilisé par

- THEIA
- Form@ter dans le cadre projet Etalab

– Compatible CREODIAS – pas avec les autres DIAS...

Dinamis, SWOT & SWOT aval, AI4GEO, GeoPortail, ...

The EOSC will allow for universal access to data and a new level playing field for EU researchers

- Easy access through a universal access point for ALL European researchers
- Cross-disciplinary access to data unleashes potential of interdisciplinary research
- Data funded with public money is in principle open (as open as possible, as closed as necessary)
- Services and data are interoperable (FAIR data)
- EOSC helps foster the spreading and uptake of open science practices

Vision à terme : 13 Datacenters de niveau régional

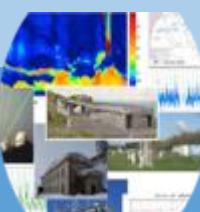

construits sur : - le réseau des mésocentres de calcul
- le réseau régional des SI de l'état
- le réseau des SI des rectorats
- les initiatives en cours dans les collectivités territoriales, les COMUEs, les projets CPER, ...

ex : réseau des mésocentres de calcul

(2014) Puissance totale ~1 PFlop Stockage total ~15 Po

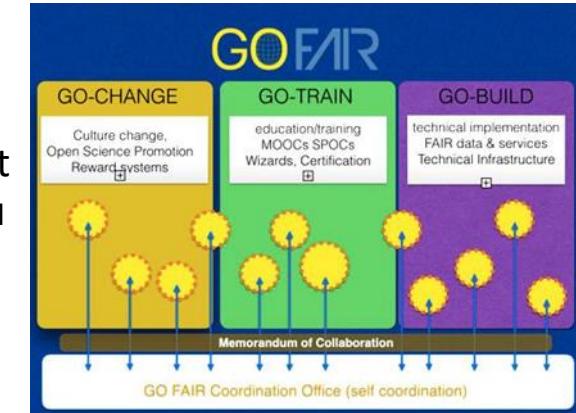

● < 5 TFlops
● 5-10 TFlops
● 10-20 TFlops
● > 20 TFlops
● 145 TFlops

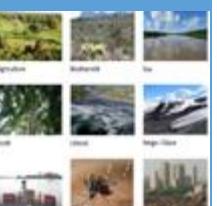

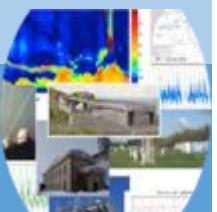

'Technical harmonization'

- Paradigm change from CNES point of view
 - Satellite data is not anymore the main source of data
 - The user community is not only the scientists close to space agencies (eg PIs)
 - => Classical standardization forums (CEOS, GEO, ESA DCB, NASA, OGC, ISO, ...) are still useful
- Standardization forums of Science / Earth Science
 - Interpole working group
 - Created in 2014 to promote technical exchange between the Data & Service Hubs
 - A two-days workshop every 6 months
 - Example of topics
 - Long term preservation, Authentication & Authorization, catalogues, formats, DOI, Licenses, processing, ...
 - RDA – Research Data alliance
 - 95 working groups !
 - RDA Europe deeply involve in EOSC
 - H2020 : ENVRI+ / ENVRI FAIR in an ESFRI context
 - ENVRI & ENVRI FAIR similar to Interpole at European level
 - Work on progress to combine both activities
 - GO FAIR initiative in the context of EOSC
 - Germany + France + The Netherlands
- Interoperability of processing chains ?

Réponses à AO Européens – sur sollicitation MESRI

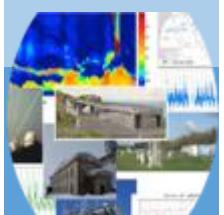

- PHIDIAS
 - Réponse à AO CEF (mi-novembre)
 - WP1 : Management
 - WP2 : Compute and storage workflow management
 - WP3 : Technical coordination, development of the common system
 - WP4 : Intelligent screening of large amount of satellite data for detection and identification of anomalous atmospheric composition events

Technical Solution

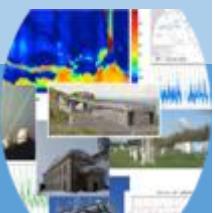

Overarching principle of operation

- Main motivation of the “Earth System” Research Infrastructure
 - not to re-invent the wheel
 - but to take benefits on existing initiatives by improving the standardization and the interoperability of the systems already in place.
 - Base developments on open source software with wide communities
- Improve transdisciplinarity and across domain interoperability.
- Facilitate access to both space data AND in-situ data..
- Take into account the evolution of the computing infrastructure landscape
 - in France (Infranum) and in Europe (EOSC, DIAS, ...)
 - and to be able to integrate into this ecosystem.
- Re-use of what has been done in each Data and Services Hubs (ODATIS, THEIA, ...).
 - In order to encourage this re-use and to push for the sharing of practices, a working group (named Interpole) was set up four years ago.
 - » technical experts from each Hub to explore technical topics of common interest
 - » DOI, Long Term Preservation, Catalogue, Format, SSO, processing, ...
 - this work takes in account and implements the recommendations established by the Working Groups of the Research Data Alliance (RDA).

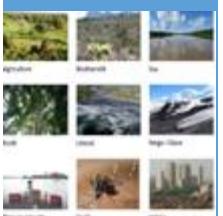

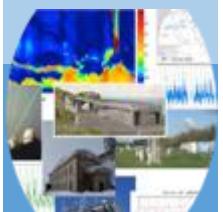

Overarching principle of operation

- For space data
 - possible to rely on a long history of standardization
 - through the following organizations (CEOS, GEO and OGC).
- For data observed in-situ
 - more complicated
 - » due to the variety of the observation systems
 - » and the manual work at laboratories to analyze samples
 - » and due to the number of thematic fields that are considered: physics, chemistry, geology, biology and biodiversity, genomics...
 - However, several initiatives, funded by the EC and the Members States, have also been conducted for several years to make in-situ data more findable and accessible.
 - » SeaDataNet and EMODNet, EuroArgo, EMSO, Jerico have set up data management systems, standards and tools to let users retrieve, display and access data sets
 - » ACTRIS, EPOS, ..
 - » More recently, all these research infrastructures have been federated within a cluster called ENVRI.

Inspiring models

- NASA EOSDIS hub
 - Common Metadata Repository / Unified Metadata Model
 - Combined with their progressive migration toward cloud computing
- Hub Pangeo (^{Opensource}~datacube)
 - Already used for atmosphere, ocean and climate data
- GeoDAB: GEOSS data hub
- EuroGEOSS, AmeriGEOSS, NextGEOSS
 - CKAN & cloud computing capabilities
- ESA DCB Initiative: ‘Network of Exploitation platforms’
 - And their cloud initiatives: DIAS, TEP/MEP/MAP
- ENVRIfair H2020 project
 - Naturally linked to EOSC
 - French Data&Services Hubs are part of the consortium
 - IAGOS, ACTRIS, EURO-ARGO, EPOS, EMSO, ANAEE, SeaDataCloud, ...

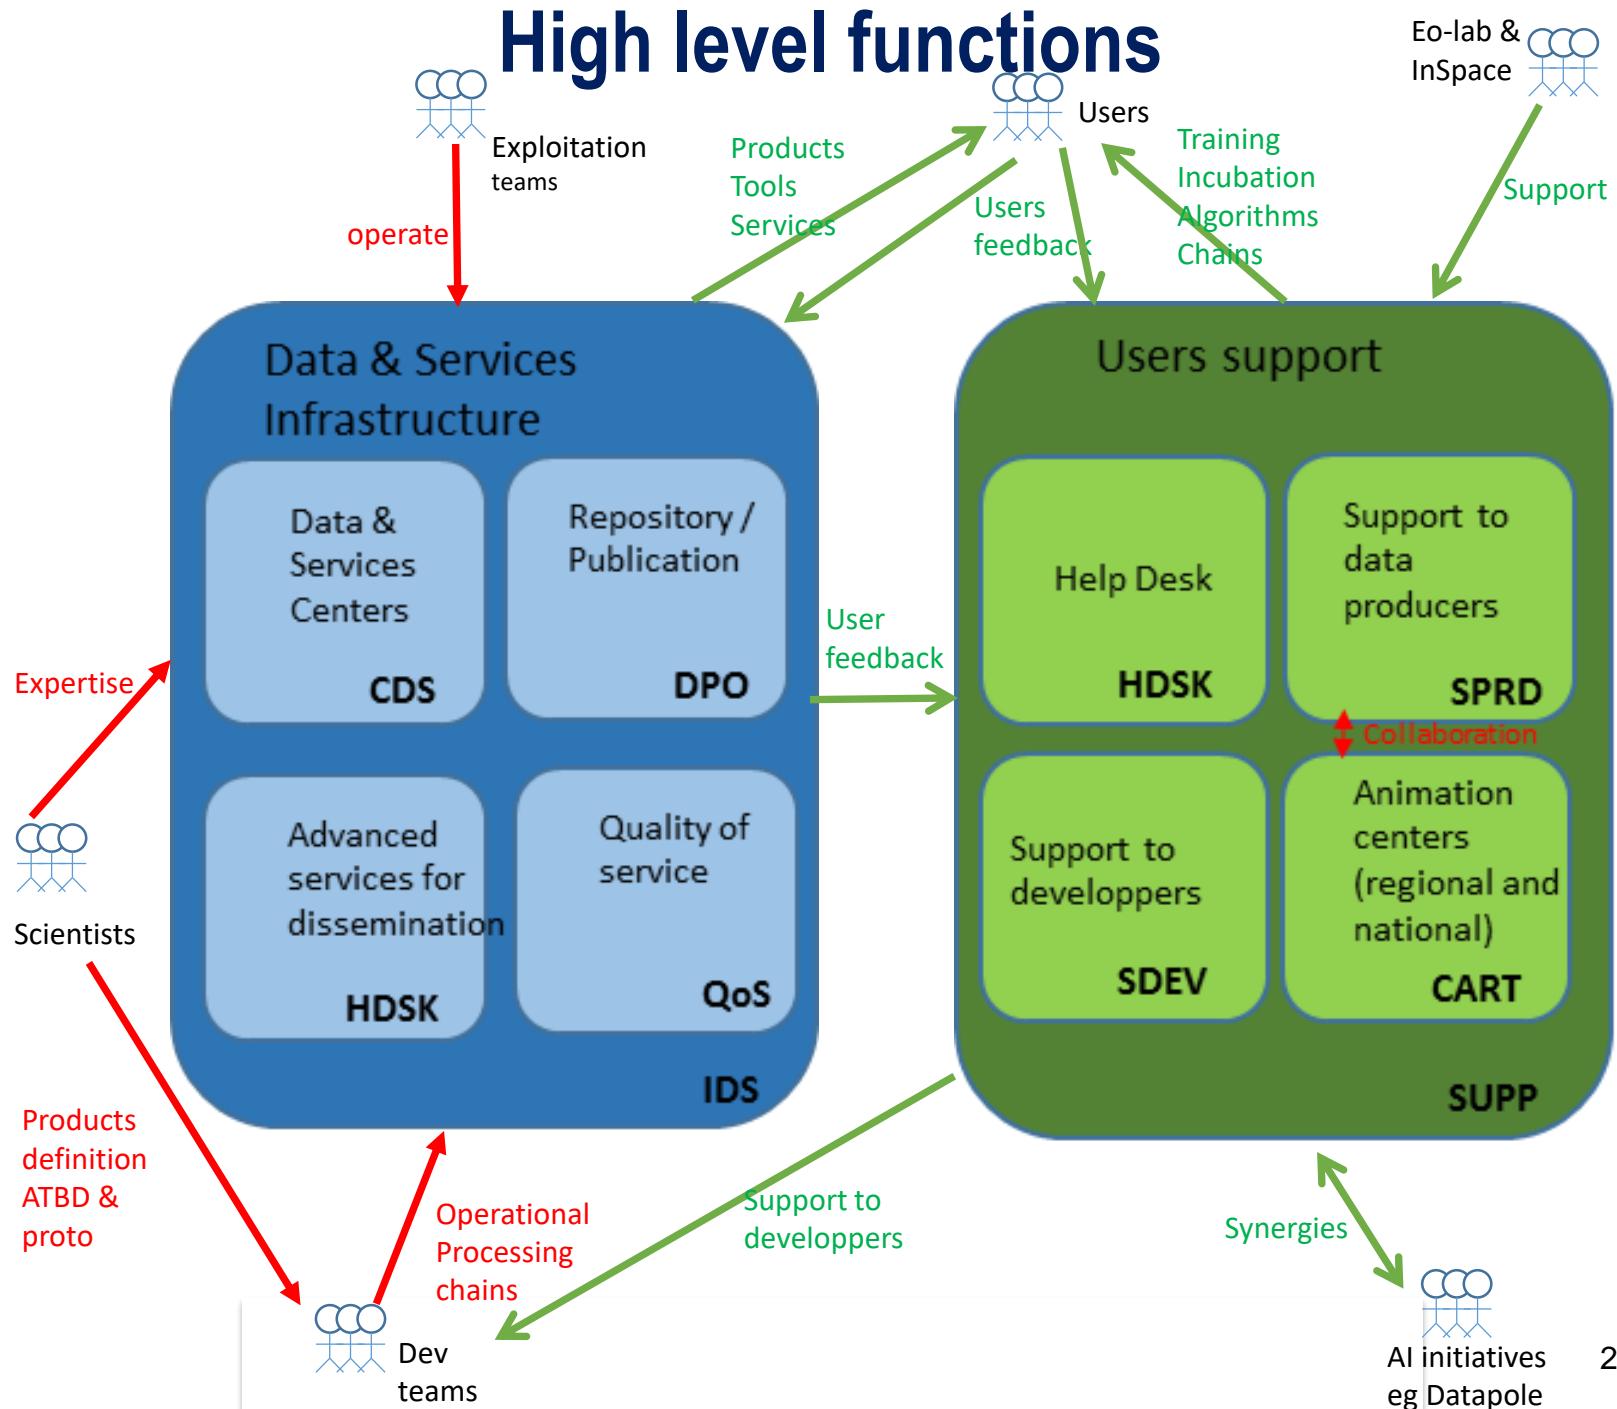

Processing Topology

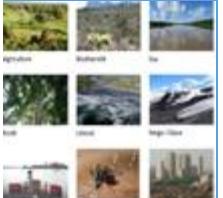

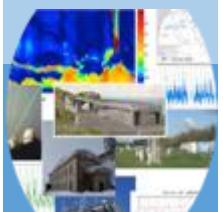

- Increase of data volumes
 - => better to **bring the processing close to the data**
 - Not for everyone; downloading data is still an option
 - Cf Copernicus dissemination statistics
 - Very interesting for newcomers (eg startup, ...)
 - Mandatory for very big volumes e.g. NISAR
- Need to **combine data** from different compartments
 - => have data very close from each other
 - In the same cluster
 - e.g. NASA EOSDIS evolution (AWS) & Copernicus CGS evolution
 - In a limited number of cluster linked with high speed network
 - e.g. : WeKEO, Current CGS architecture, AERIS/ESPRI, INFRANUM (AC),
 - EOSDIS (DAAC)
 - Distributed in several data centers not linked with HS network
 - Use ad-hoc technologies to give unity to the system
 - e.g. Ceph object storage / IRODS / ...

Increasing
distance
↓

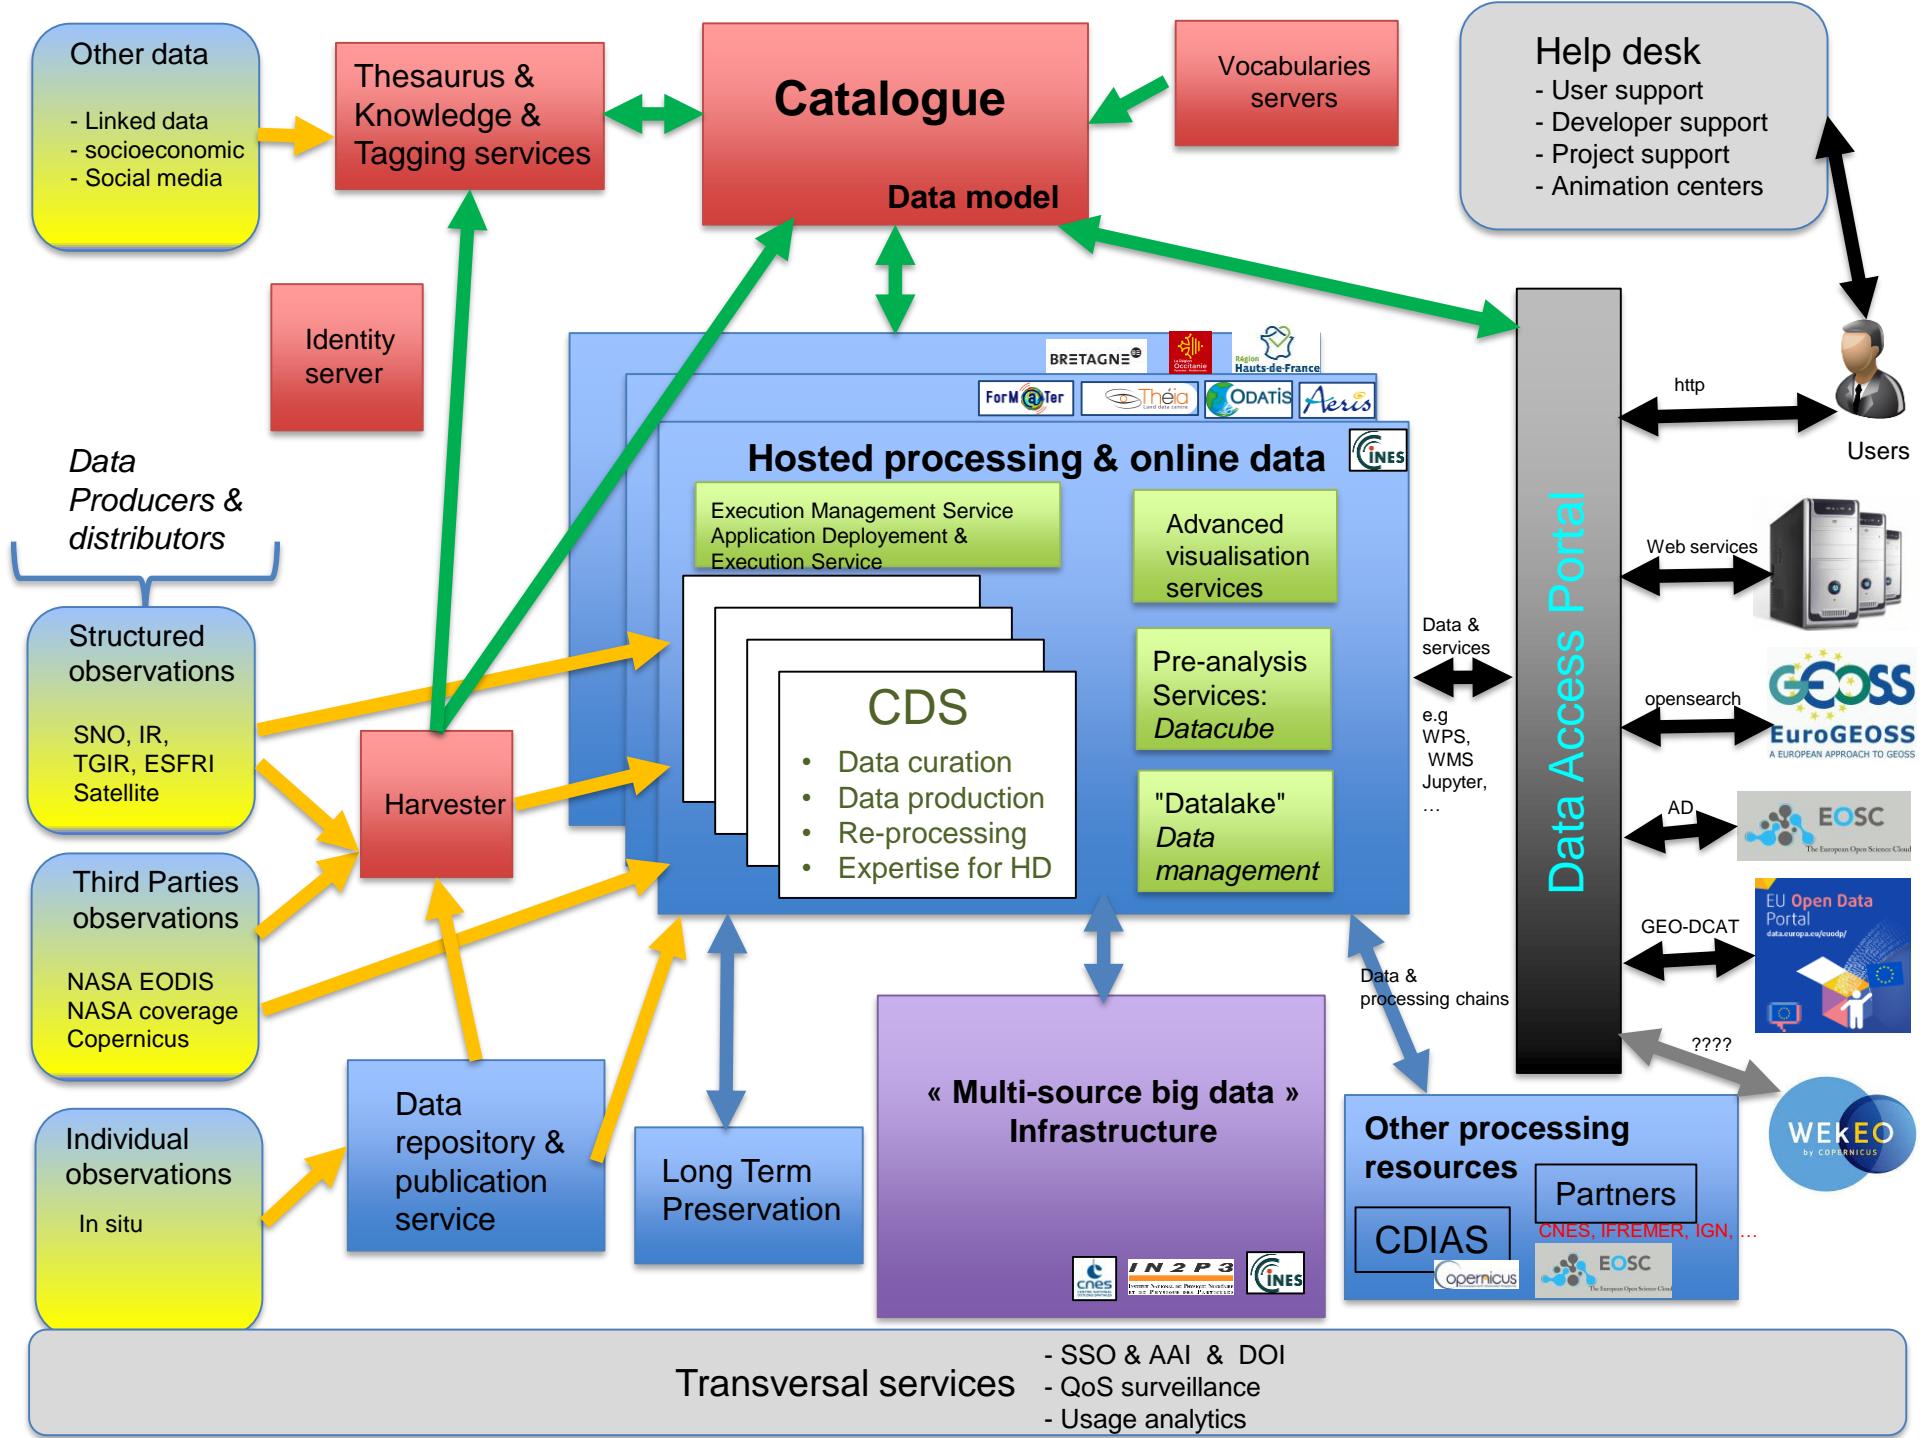

High level functions

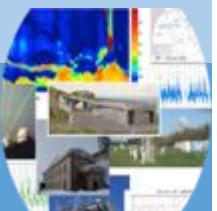

Key ideas

- Strong and operational help desk
 - To support users
 - e.g. allow feedback on datasets
 - e.g. present locally : CART
 - To help set up new projects : Development support
 - Support to data and processing migration
 - Capacity building : AI, Cloud computing, coding language, orchestration, DevOPS, ...
- Collocate data as far as possible
 - To ease the combination between data from different compartments
 - As a consequence of the “*bringing the processing close to the data*” paradigm
 - Datalake technologies – smooth/efficient data management tool
 - CNESdatalake | ENS(Elastic Node Server)/dhus (ESA) | AERIS/ESPRI (Ceph, ...), NASA EOSDIS, ...
- Operational and trustworthy catalogue of data & services
- Foster interoperability between processing platforms
 - DIAS, EOSC, INFRANUM, PRACE, ...
- Not techno push
 - Need from users and IR ST strategy
- Quality of service
 - IR ST system monitoring / analytics
- FAIRisation of data

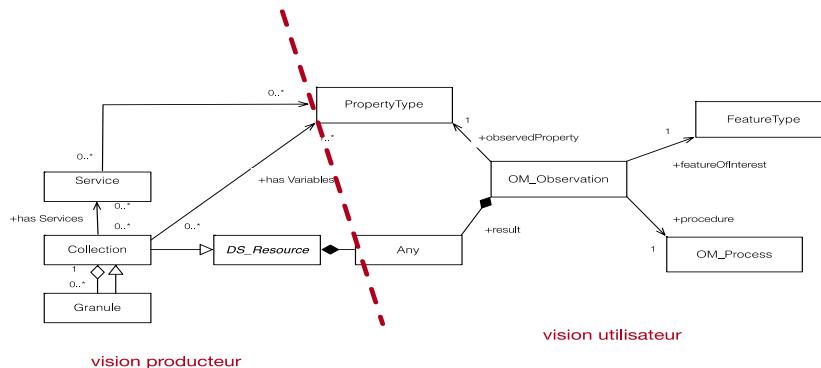

Data: IR ST data catalog

- A unique, operational catalog
 - Containing all data metadata and pole services
 - Like the NASA EOSDIS CMR (<https://earthdata.nasa.gov/about/science-system-description/eosdis-components/common-metadata-repository>)
 - Requires a unified data model (~ UMM NASA & HMA ESA)
 - Taking into account spatial data, in-situ, models, ...
 - Based on ISO and Inspire recommendations for example
 - Work in progress as part of the 'Interpole' catalog WG
 - Vocabularies / ontologies
 - adoption and maintenance of commonly agreed vocabularies and ontologies,
 - set up of standardized vocabulary servers
- With interfaces
 - interoperable
 - INSPIRE, CEOS opensearch, Linked data / RDF, Geo DCAT, WIGOS / WMO standards, ...
 - Adaptable (nothing is fixed)
 - **Two step search:** collections then granules
 - CEOS connected data assets, GEOS, NASA EOSDIS, ESA FedEO, ...

Data model

- Study led by Interpole

- Definition of a pivotal model that will allow us to interface with different standards
 - INSPIRE, CEOS opensearch, EOSC, ...
- Two levels : collection and granule
 - Two-step search (big number of granules)
 - Applicability to in-situ data is to be verified.
- Idea : base the data model on adaptation of the NASA data model & vocabularies
 - UMM-G / UMM-C & UMM-S
 - GCMD keywords
 - SWEET ontology

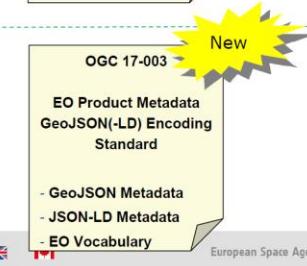

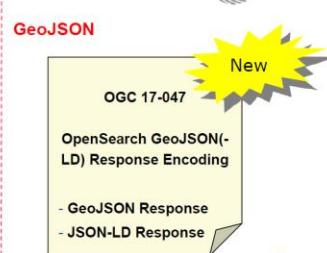

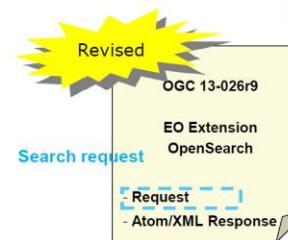

Activity Results

- 3 specifications

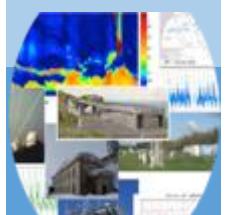

Search Response EO Metadata format

Including:

- OGC 17-047 JSON Schema file, JSON-LD @context
- OGC 17-003 JSON Schema file, JSON-LD @context
- OGC 17-003 OWL EO vocabulary

Computing Infrastructures

- Target = INFRANUM
 - Progressive but determined approach
 - Migration when data is used in a transverse IR ST framework (SCO example)
 - Migration when IT means become obsolete
 - Some datasets may not be migrated
 - Old and little used
 - Necessary proximity of the producer in case of a reasonable data volume: case of certain **in-situ data** => concept of technical cache
- Ability to be distributed across multiple sites
 - At the beginning the IR ST will still be spread over several CDS themselves distributed over several sites
 - On opportunities to be able to switch to external means like DIAS or EOSC
 - Eg for European projects
- Need for adaptation & fine analysis
 - INFRANUM \Leftrightarrow HPC : not compatible with the IR ST way of working
 - => need for adaptation of INFRANUM centers to be able to cope with HPDA or HTC
 - All IR ST compute services may not be able to join INFRANUM
 - Even if there is an evolution of INFRANUM
 - **Analysis & discussion with INFRANUM are necessary**

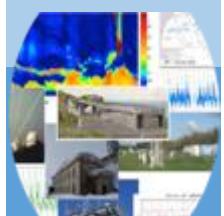

Computing Infrastructures

- **INFRANUM not operational within 3 years**
- Target is also **EOSC**
 - How is it compatible ?
- **Intermediate step** on relatively limited means
 - Temporary infrastructure to choose
 - **CINES** (most probable solution) : *EUDAT => EOSC*
 - CALMIP or any regional INFRANUM center
 - CNES, IFREMER, IGN, any IR ST CDS infrastructure
 - DIAS
 - EOSC \Leftrightarrow EUDAT, EGI, ...
 - A way to learn and validate the consideration of user needs
 - Software for the intermediate stage
 - Limit specific developments (at least for this step)
 - Catalog and data hub (CKAN, NASA CMR, CNES datalake, ...)
 - 'Modern' means of processing data: Datacube + Jupyter / Pangeo / ...
 - Rapid Implementation of Development / Migration Support service

Computing Infrastructures

- Il est illusoire de penser que l'IR ST pourra être concentré sur **un seul et unique MesoCentre d'INFRANUM**.
- Mais une fois INFRANUM en place la distribution de l'IR sera limitée aux MesoCentres régionaux et nationaux
 - Bretagne
 - Haut De France
 - Calmip (Occitanie)
 - ...
- Avec prise en compte des MesoCentres nationaux
 - IDRIS, CINES, IN2P3
 - Notamment pour la combinaison des données très volumineuses
 - Et / ou besoin de très gros moyens de calculs
- D'où une architecture distribuée
 - Pour les données
 - Et les traitements
 - Avec les solutions techniques afférentes

Découpage en WP

Planning

- “T0” arbitrairement positionné au 01/01/2019 car :
 - la 1ère réunion GT_TECH a eu lieu en janvier 2019
 - De même que le kick-off d’ENVRI-FAIR - projet structurant pour l’IR_ST
- planning guidé par le besoin, mais aussi par les ressources et les contraintes :
 - la durée des projets sur lesquels l’IR_ST va s’appuyer
 - ENVRI FAIR : 4 ans à partir de 15/01/2019
 - PHIDIAS (si retenu) : 3 ans à compter de mai 2019 ~ To+41M
 - EOSC-Pillar : 3 ans à compter de ~ avril 2019 ~ To+40M
 - AERIS/SSO : 1 an à compter de ~ juin 2019 ~To+18M
 - THEIA/metacatalogue : 1 an ? à compter de février 2019 : To+13M
 - Etude CNES/Catalogues : 6 mois à compter de mai 2019 : To+11M
 - La mise en place d’INFRANUM qui ne devrait pas être opérationnel avant début 2023 (To+48M)
- Un autre élément dimensionnant est l’AO PIA3
 - Il faudra être déjà prêt avant son ouverture
 - Ce budget est nécessaire à la mise en place de l’IR_ST

Logique pour choix techniques

- **Décision collégiale** avec groupe resserré GT_TECH
 - 5x2 personnes, 2 par pôle
 - Animé par le DT IR ST (3 personnes)
 - Support ponctuels possibles (CNRS, CNES, IFREMER, IRSTEA, ...)
- On garde GT_INTERPOLE : approche bottom-up
- Dans la limite du possible
 - **Eviter les développements dédiés**
 - Pas techno push, mais partir des **besoins utilisateurs**
 - Chercher des solutions opérationnelles et fiables sur étagères
 - Dans les pôles
 - Chez les partenaires / tutelles (outils génériques, résultats de R&D)
 - ENVRI fair
 - H2020 (NextGEOSS, OBESS, EOPEN, OPENEO, BigDataEurope, GeoCraddle, ...)
 - Mise en place de **PoC** pour **valider l'adéquation au besoin**
